Removing Emails from Access List

Question: What happens to files already uploaded by an email that later gets removed?

Debate:

- **Option A:** Files remain, only future uploads blocked (lenient, less data loss).
- **Option B:** Files tied to that email are hidden or flagged (privacy/security strictness).
- **Option C:** Owner decides with toggle at removal (keep or purge).

Filtering by Email

Question: If a link has many files shared by different emails, how do we filter?

Debate:

- **Option A:** Store email metadata per file → allow direct filtering.
- **Option B:** Group uploads per email → structured browsing by contributor.
- **Option C:** Use tags/labels in DB, emails only for permissions (less granularity, lighter queries).

Verdict

- **Option A:** Store email metadata per file → allow direct filtering.

💡 Folder/Link Deletion

Question: What happens when a folder tied to a link is deleted?

Debate:

- **Option A:** Cascade delete → removes folder (also content), link, and all associated email permissions.
- **Option B:** Archive state → mark folder/link inactive, preserve metadata and files for recovery.
- **Option C:** Detach link but keep folder (unlinking model).

Verdict

💡 Email Access Control

Consideration:

- Users can add/remove emails from access list.
- Link can be public or private.
- Public links: anyone can upload → if email not on list, should it auto-add or not?

Debate:

- **Option A (Lenient):** Auto-append first-time uploaders on public links. Switching to private keeps their access.
- **Option B (Strict):** Public accepts uploads, but does not auto-append. Owner must manually add emails for continuity.

Verdict

- **Option A (Lenient):** Auto-append first-time uploaders on public links. Switching to private keeps their access.
- The user decides which email to remove from the access list. Removing or adding emails to the access list won't have any effect if the link is public.
